## **L2**

Pip is a tool that installs Python packages. We can install pandas like below.

```
In [ ]: ► I #!pip install pandas
```

Now, we can import pandas. It's a widespread convention to import pandas with alias as pd.

```
In [13]: ► import pandas as pd
2 import numpy as np
```

read\_csv() method from pandas reads a tabular data into a pandas DataFrame. DataFrame is a data structure that pandas uses that has rows and columns and their corresponding labels

Check the DataFrame if it was read correctly

```
In [6]:
                     DIS
    Out[6]:
                              Date

                                                                          143.770004
                                                                                      143.770004
                                                                                                   6602800
```

numpy.dtype shows data type. Data type 'o' is an object.

Make a column with name 'date\_format'. 'to\_datetime' converts argument to datetime. Inside the function 'to\_datetime', give 'format'. You can specify the format of the date you use. For example,

'%d/%m/%Y' or '%m/%d/%Y'.

```
In [9]:  DIS['date_format'] = pd.to_datetime(DIS['Date'], format="%m/%d/%Y")
```

Let's chect date format column in DIS data.

```
In [10]:
                  DIS.date_format
    Out[10]:
                      1962-01-02
              1
                      1962-01-03
              2
                      1962-01-04
              3
                      1962-01-05
                      1962-01-08
                          . . .
              14594
                      2019-12-23
              14595
                      2019-12-24
              14596
                      2019-12-26
              14597
                      2019-12-27
              14598
                      2019-12-30
              Name: date format, Length: 14599, dtype: datetime64[ns]
```

Let's check data type of date format. '<M8[ns]' is a specific type of datetime.

```
In [11]:  DIS.date_format.dtype
Out[11]: dtype('<M8[ns]')</pre>
```

Let's export csv data to file. 'index = False' will let you export the dataframe without index.
